

231 for herding or driving cattle and the natives seemed much surprised
[262] at the idea. They are not eaten and the idea is considered disgusting, although there is no definite taboo on it. There seemed to be no dogs in many villages and their economic importance is slight.

Cattle are all of the humped or zebu variety, with moderately long sideward curving horns. The size of the hump varies with the animal's age and condition and is hardly noticeable in many cases. There is a great variety of colors and markings, each known by a special name, but black and white seem to predominate. There are said to be a few wild cattle, descendants of escapes, which are very shy and live in the heavy forest.

293 The cattle belonging to each village are herded together by boys, with, in the old days, a few armed men for protection. During the day they are allowed to graze anywhere on land that is lying fallow. At night they are driven into pens, which are now on the outskirts of the villages. In the old days the pens were often in the village and the cattle were driven within the stockade if an attack threatened.

417 The Menabe cattle pens are like large, roughly built houses with thatched roofs and open sides. Among the Ikongo, who live in less rainy territory, the pens are usually open. They are made from posts planted about 2 feet apart and laced together with withes or vines. Two posts, planted one behind the other, stand on each side of the entrance, which is closed by dropping long saplings in between them. Semi-subterranean pens of the plateau type are unknown among the Tanala. The pens are never cleaned and in some I saw the manure had accumulated to a depth of over 3 feet.

422 The Ikongo have a regular system of ownership marks, made
618 by cutting one or both ears in various patterns. These marks are
233 hereditary in lineages and there are sometimes stories to account for their origin. Families within the lineage usually have no individual marks. The Menabe rarely earmark their cattle, their herds being so small that ownership is never in question.

• 232 There is no attempt at systematic cattle breeding and it does not seem to have occurred to the natives that their herds could be improved in this way. One informant expressed surprise when I told him of our methods, then said that after all the matter took care of itself, for the best bull would defeat the others and take all the cows.

825 Young bulls are often castrated, but solely with the idea of improving the flesh. A Menabe informant said that two bulls in a herd must always be castrated at the same time, so that they could
